

Design a personal finance web app that feels simple, friendly, familiar, and made for everyday life.

This should NOT feel like:

- a bank
- a fintech product
- an accounting platform
- a corporate SaaS dashboard
- a luxury or “premium” financial product

Instead, it should feel like a personal household app — something I would casually open at home to understand how my month is going.

Think of it as a digital household notebook for money, but organized and intelligent.

The feeling should be:

- warm
- approachable
- calm
- simple
- slightly playful
- personal
- practical
- human

It should feel designed for a person, not for a finance department.

Visual direction

Use a soft, light interface.

Prefer:

- warm off-white or very light neutral backgrounds
- simple typography
- comfortable spacing
- subtle, friendly colors
- small illustrations or icons where useful
- simple cards
- gentle rounded corners

- clear but informal labels
- charts that are easy to understand
- visual hierarchy without looking analytical or corporate

Avoid:

- dark fintech aesthetics
- black + neon
- luxury styling
- glassmorphism
- gradients everywhere
- stock-market aesthetics
- overly sophisticated data visualization
- dense Bloomberg-style dashboards
- corporate admin tables
- overly polished “enterprise SaaS” UI

The app can have personality.

It should feel closer to a well-designed home organization app than to a bank.

Language and tone

The interface should use natural everyday language.

Instead of overly financial terminology, prefer things like:

“How did August go?”

“You spent”

“You saved”

“Your usual expenses”

“Extra this month”

“Where your money went”

“Compared with July”

“Your monthly goal”

“Things to review”

Avoid making every section sound like an accounting report.

Dashboard

The Dashboard is the home of the app.

At the top, make the month feel prominent and easy to navigate:

← August 2026 →

with an easy way to switch between:

Month

Year

All time

The first section should answer:

“How did August go?”

Show:

Income

\$8,756

Spent

\$5,766

Saved

\$2,990

34% saved

Do not make these look like banking KPI cards.

They should feel like a simple monthly summary.

Then show something very important:

“Your usual expenses”

\$4,240

And:

“Extra this month”

\$1,526

Mostly travel

This distinction should be very easy to understand.

The user should immediately understand:

“I spent \$5,766, but my normal life actually cost around \$4,240.”

Where your money went

Show categories in a friendly visual way.

For example:

Home

\$902

Food

\$646

Transport

\$126

Health & sport

\$217

Subscriptions

\$96

Shopping & fun

\$454

Travel

\$1,526

 Gifts & donations
\$0

 Taxes
\$209

Each category can have a simple progress indicator showing how it compares with the monthly budget.

Avoid making this look like an accounting table.

Monthly goal

Show the savings goal in a friendly way.

For example:

“Your goal”

Save 40% of your income

You saved 34%

\$512 away from your goal

Use a simple progress visualization.

No gamification, badges, streaks or aggressive warnings.

Compared with previous months

Include a simple section:

“Compared with July”

Spent
+\$320

Usual expenses
-\$85

Saved
-\$240

Then show a simple 6-month chart.

Keep charts visually light and understandable.

Trends

Allow me to explore:

Monthly
Year to date
Year

I should be able to see:

Income
Spending
Savings
Usual cost of living

over time.

But don't overwhelm the main dashboard with analytics.

Detailed trends can live further down the page or behind "See details".

Import

Importing should feel extremely casual.

Title:

"Add this month's transactions"

Subtitle:

Upload your bank and card files and we'll organize them.

Drag-and-drop area:

Drop your CSV files here

or

Choose files

After uploading:

Santander pesos ✓

Santander dollars ✓

Credit card ✓

Then:

204 movements found

187 organized automatically

12 need your help

5 were already imported

CTA:

Review 12 transactions

Review

Make this feel like cleaning up a small inbox.

Title:

“Just a few things to review”

Subtitle:

We weren't sure where these belong.

Each transaction should be very easy to classify.

Example:

GABRIEL BURSZTEIN

-\$717

Where should this go?

[Gifts & donations ▼]

Optional:

☒ Remember this for next time

The experience should feel fast and lightweight.

At the top:

8 of 12 done

When everything is reviewed:

“All done ✓”

CTA:

Finish August

Transactions

Transactions should look more like a clean activity list than an accounting ledger.

Group transactions by date.

Example:

TODAY

PedidosYa

Food

-\$32

Uber

Transport

-\$14

YESTERDAY

🏠 Rocío Velasco
Rent
-\$900

Allow search and filters, but keep them visually secondary.

Budget

Do not make this feel like budgeting software.

Call the page:

“Monthly plan”

Show something like:

August plan

Expected income
\$8,756

Plan to spend
\$5,250

Goal to save
\$3,500

Then show categories.

Food

\$646 of \$700

\$54 left

Use plain language like:

“\$54 left”

instead of financial/accounting terminology.

Categories

Use familiar categories with simple visual identities:

-  Home
-  Food
-  Transport
-  Health & sport
-  Services
-  Subscriptions
-  Shopping & fun
-  Travel
-  Gifts & donations
-  Taxes
- ... Other

Icons should help scanning but should not make the interface childish.

Navigation

Keep navigation extremely simple:

- Home
- Transactions
- Add transactions
- Monthly plan

Put more technical things under Settings:

- Rules
- Accounts
- Categories
- Currency
- Income sources

The user should not have to think about “Rules” during normal usage.

Rules

Rules are an implementation detail.

Do not make them a prominent part of the product.

Most rules should be created naturally from the Review flow through:

“Remember this for next time”

Advanced users can manage them from Settings.

Overall product feeling

The app should feel like:

“I sit down once a month, upload my statements, fix a handful of things, and immediately understand my money.”

Not:

“I am operating financial management software.”

Prioritize familiarity and ease over sophistication.

Use the August example data when designing:

Income: \$8,756

Spent: \$5,766

Saved: \$2,990

Savings rate: 34%

Usual expenses: \$4,240

Extra this month: \$1,526

Design the Home/Dashboard first.

Establish the visual language there before designing the rest of the application.
